1* Intro. This little program outputs clauses that are satisfiable if and only if the graph g can be c -colored, given g and c .

(It generalizes SAT-PIGEONS, which is the case where $g = K_m$ and $c = n$.)

Suppose the graph has m edges and n vertices. Then there are nc variables $v.k$, meaning that vertex v gets color k . And there are n clauses of size c (to ensure that each vertex gets at least one color), plus mc clauses of size 2 (to ensure that adjacent vertices don't share a color).

```
#include <stdio.h>
#include <stdlib.h>
#include "gb_graph.h"
#include "gb_save.h"
int c;
int n; /* order of flower snark line graph (a command-line parameter) */
char buf[20];
main(int argc, char *argv[])
{
    register int i, j, k;
    register Arc *a;
    register Graph *g;
    register Vertex *v;

    < Process the command line 2*>;
    < Generate the positive clauses 3*>;
    < Generate the negative clauses 4*>;
}

2* < Process the command line 2*> ≡
if (argc ≠ 2 ∨ sscanf(argv[1], "%d", &n) ≠ 1) {
    fprintf(stderr, "Usage: %s s n\n", argv[0]);
    exit(-1);
}
sprintf(buf, "fsnarkline%d.gb", n);
g = restore_graph(buf);
if (¬g) {
    fprintf(stderr, "I couldn't reconstruct graph %s!\n", buf);
    exit(-2);
}
c = 3;
printf("~ sat-color-snark-subset %d\n", n);
printf("b1.1\n"); /* start with three unary clauses to break symmetry */
printf("c1.2\n");
printf("d1.3\n");
```

This code is used in section 1*.

```
3. < Generate the positive clauses 3*> ≡
for (v = g-vertices; v < g-vertices + g-n; v++) {
    for (k = 1; k ≤ c; k++) printf("%s.%d", v-name, k);
    printf("\n");
}
```

This code is used in section 1*.

```

4*  ⟨ Generate the negative clauses 4* ⟩ ≡
    for (k = 1; k ≤ c; k++)
        for (v = g→vertices; v < g→vertices + g→n; v++)
            for (a = v→arcs; a; a = a→next)
                if (a→tip > v)
                    if ((v→name[0] + a→tip→name[0] ≠ 'e' + 'f') ∨ v→name[1] ≠ '1' ∨ v→name[2] ∨ (v→name[0] ≡
                        'e' ∧ (k ≠ 3 ∨ (a→tip→name[1] ≡ '2' ∧ a→tip→name[2] ≡ 0))) ∨ (v→name[0] ≡ 'f' ∧ (k ≠
                        1 ∨ a→tip→name[1] ≠ '2' ∨ a→tip→name[2])))
                        printf("%s.%d_~%s.%d\n", v→name, k, a→tip→name, k);

```

This code is used in section 1*.
